How These Components Work Together in an ATM

The internal architecture of an ATM is designed for seamless integration of hardware and software components to deliver secure and efficient transactions. Here's a step-by-step overview of how these components function during a typical cash withdrawal:

- Card Insertion and Reading: The customer inserts their card into the card reader, which reads the card data securely.
- PIN Entry: The customer inputs their PIN via the keypad; this data is encrypted immediately.
- Transaction Request: The customer selects the desired transaction (e.g., withdrawal, balance inquiry).
- Communication with Banking Network: The ATM sends encrypted transaction data over a secure channel to the bank's host server.
- Authorization and Processing: The bank verifies the account details, PIN validity, and available funds.
- Response and Dispensing Cash: Upon approval, the ATM's processor commands the cash

dispenser to release the specified amount.
- Receipt Printing: A transaction receipt is printed and dispensed.
- Session Termination: The card is returned, and the transaction is logged for records.

Security Aspects of ATM Internal Structure

Security is the backbone of ATM design, given the sensitive nature of financial transactions. Several internal components and protocols are dedicated to protecting user data and preventing fraud:

- Encryption Modules: Secure PIN and data transmission.
- Secure Hardware Modules: Tamper-proof enclosures and sensors.
